

dialtone.menu — Features page copy

This is the page copy structured into sections matching the strategic outline.

Each section includes:

- Section structure note
- Headline + supporting copy
- Recommended visuals
- Suggested implementation notes for the Svelte component

Tone is direct, concrete, restaurant-owner-readable. No marketing fluff, no buzzwords, no "revolutionize your business." Every claim is something you can stand behind in a sales conversation.

HERO SECTION

Structure: Full-width hero, voice sample player as the visual anchor. Audio is the hero, not an image.

Headline:

Your phone, answered.
Every time. In your voice.

Subhead:

DialTone is an AI voice agent that takes phone orders for your restaurant — through the lunch rush, after hours, while you're plating tickets. Built for pickup, dine-in, and the customers who'd rather call than tap.

Primary CTA: "See pricing" (link to /pricing) **Secondary CTA:** "Talk to us" (link to your booking/contact)

Above the fold visual: The voice sample player. Headline "Hear it yourself" with a single prominent play button. Caption underneath: "30 seconds of a real DialTone order, no edits."

Implementation note: The voice sample matters more than any text on this page. Give it visual prominence — at least 200px tall, centered, with an obvious play affordance. If you have multiple samples for different voices, add a small voice selector underneath ("Hear a different voice: Warm / Upbeat / Refined").

SECTION 1: The phone rings

Structure: Two-column on desktop, stacked on mobile. Left: copy. Right: animated phone illustration or simple line graphic showing "missed call rate before / after."

Section eyebrow: *Lunch rush, Friday, 12:14 PM*

Headline:

The phone never stops ringing.
Neither does DialTone.

Body:

Your team is in the weeds. The hostess is seating a four-top. The line cook is on his third reset. The phone has been ringing for two minutes, and the customer on the other end is about to hang up and call Pei Wei. DialTone picks up on the first ring. It answers in the voice you chose, takes the order, reads it back, and texts the customer a payment link. Your team never touches the phone.

Inline metric callout:

<1 second to answer
24/7 availability
0 missed calls

Implementation note: The three metrics should be visually weighted as equal blocks — small, clean, no icons. They're proof points, not features.

SECTION 2: The order lands in the kitchen

Structure: Two-column desktop, stacked mobile. Left: copy. Right: a real screenshot of the kitchen card with order #47.

Section eyebrow: *On the kitchen display, before the customer hangs up*

Headline:

The order shows up where the food gets made.

Body:

The moment the customer confirms, the order is on your kitchen display. No paper ticket to lose. No staff member shouting "Volcano Roll, no mayo, table 12!" across the line. Each card shows the items, the modifiers, allergens flagged in red, and a #47 you can actually say out loud. The kitchen builds the order. When it's ready, one tap marks it done.

Sub-points (three small blocks, not bullets — visual cards):

Modifiers built in. Mild, medium, hot. Sauce on the side. No cilantro. The customer's choices are structured, not buried in notes.

Allergens flagged. Severe allergies get a red banner at the top of the card. The kitchen sees it before they see the food.

Real order numbers. "Order forty-seven" works on the phone, on the receipt, at the counter. Nobody reads UUIDs aloud.

Implementation note: Kitchen card screenshot should be from your real, production product — same one shown in your kitchen board. Show one card with realistic data: a couple items, modifiers, the #47.

SECTION 3: The customer pays

Structure: Two-column. Left: copy. Right: screenshot of phone showing the SMS + a screenshot of the Stripe embedded checkout page.

Section eyebrow: *Within 30 seconds of confirming*

Headline:

They tap. You're paid.

Body:

Right after the call, the customer gets a text with their order details and a payment link. They tap, see the receipt, add a tip if they want, and pay with Apple Pay, Google Pay, or a card.

The payment hits your account before the food is cooked. No "card was declined at pickup." No chasing down customers who walked away.

Inline payment methods row:

Apple Pay · Google Pay · Link · Visa · Mastercard · Amex

Sub-callout (one block):

Tips, not arm-twisting. The tip prompt is on the payment screen, not in the agent's mouth. Customers pick what they want — preset or custom — and the tip goes 100% to your account, not ours.

Implementation note: Two phone screenshots side by side or stacked. One showing the SMS with order details. One showing the Stripe checkout with the tip prompt. Real screens, not mockups.

SECTION 4: You see everything

Structure: Full-width screenshot of the admin orders page, with a narrower column of copy below it (or to the side on wide screens).

Section eyebrow: *From your phone, your laptop, anywhere*

Headline:

| Every call, every order, every dollar — in one place.

Body:

| The admin dashboard shows you what's happening right now. Orders pending payment. Orders in the kitchen. Orders picked up. Voice calls that didn't convert. Cancellations and refunds.
Search by phone number to find a customer's history. Resend a payment link in two taps. Cancel an order and refund the customer in three.
Print or export anything for your accountant.

Sub-points (three visual cards):

| **Live order status.** New orders appear instantly. Pending payments show a clear action button. No refreshing the page.
Customer history. Every order from every number, ready when the customer calls back. No more "do you have my address?"
Real-time revenue. Today's total, this week's total, your conversion rate, your average order value. Updated as it happens.

Implementation note: Use the redesigned admin orders page screenshot. The before/after improvement from your original screenshot to the new version is visible and impressive — but don't show "before." Show the new page as if it's always been that good.

SECTION 5: It works for your restaurant

Structure: Three-column grid on desktop, stacked on mobile. Each column is a configurable aspect of the product with a small screenshot.

Section eyebrow: *Set up once, runs itself*

Headline:

| Built for your menu. Your hours. Your voice.

Body lead:

DialTone fits the restaurant, not the other way around. Configure once, and the agent handles the rest.

Three columns:

Pick your voice

Choose from a curated library of voices that fit your brand. Warm and welcoming for a family spot. Upbeat for a sandwich shop. Refined for a steakhouse. Or bring your own — clone your manager's voice and customers won't know they're talking to AI.

Visual: a small voice picker showing 4-5 voice options with play buttons.

Set your menu

Add items, modifiers, prices, allergens. Mark items unavailable when you're out, mark them voice-orderable or not, set time-of-day restrictions for breakfast vs. lunch. Update from your phone in under a minute.

Visual: a small slice of the menu admin showing items + modifiers.

Configure your hours

Set your normal hours, holidays, lunch closures, and "kitchen closes 30 minutes before doors." DialTone tells customers when you're open and when to come back.

Visual: a small slice of the hours editor.

Implementation note: Three small screenshots, each focused on one specific UI piece. Don't try to show full pages — show the relevant section only, cropped tightly.

SECTION 6: What's coming

Structure: Single column, narrower than the rest of the page (~600px). Designed to feel like a side note, not a main pitch.

Section eyebrow: *On the roadmap*

Headline:

We ship constantly.

Body:

DialTone is built and maintained by ByteStreams, an AI-native product studio. We use the product we sell, and we ship updates weekly.

Coming soon: reservations, table-side QR ordering, multi-location management, custom voice cloning for every restaurant, and delivery via DoorDash Drive.

No CTA in this section. This is breathing room before the bottom CTA.

Implementation note: Don't promise dates. Don't make this section prominent. It's a trust signal ("they're not just a one-trick demo") and nothing more. If a feature isn't shipped yet, it doesn't have a screenshot.

FINAL CTA SECTION

Structure: Full-width, simple, single call-to-action.

Headline:

Ready to pick up every call?

Body (one line):

See pricing or talk to us about your restaurant.

Two CTAs side by side:

- **Primary:** See pricing
- **Secondary:** Book a 15-minute call

Implementation note: This is the close. The page from hero to final CTA should feel like a complete narrative: phone rings → order goes to kitchen → customer pays → you see it all → it adapts to your restaurant → we keep building → here's how to start.

FOOTER NOTES

Don't add to the page:

- "Trusted by" logos — you don't have customers to logo yet, faking this is worse than nothing
- Testimonials — same reason; once Sui's Sushi (or whoever) has been live for 30+ days, get a real quote
- A blog/resources section — premature; build the features page first, blog later when you have something to say
- A comparison table — DialTone vs. Toast vs. DoorDash. Save for sales conversations, not website

- Pricing summary — link to /pricing, don't duplicate it here

Do add when you have them:

- Real customer testimonials with photo + restaurant name (once 60 days in)
- Logos of any payment partners that allow co-marketing (Stripe, Telnyx)
- A specific case study link ("See how Sui's Sushi handles 40 calls a day")

SEO meta tags:

html

```
<title>DialTone – AI Voice Ordering for Restaurants</title>
<meta name="description" content="DialTone answers every phone call at your
restaurant, takes the order, and sends the customer a payment link. Built
for pickup, dine-in, and the lunch rush.">

<meta property="og:type" content="website">
<meta property="og:url" content="https://dialtone.menu/features">
<meta property="og:image" content="https://dialtone.menu/og-features.png">

<meta name="twitter:card" content="summary_large_image">
```

Open Graph image: Generate a 1200x630 image with the headline "Your phone, answered." over a clean DialTone-branded background. This is what shows when someone shares the page on Twitter/LinkedIn/iMessage.

Schema markup (for SEO):

Add Product structured data so Google understands what DialTone is:

html

```
<script type="application/ld+json">
{
  "@context": "https://schema.org",
  "@type": "Product",
  "name": "DialTone",
  "description": "AI voice ordering for restaurants",
  "brand": { "@type": "Brand", "name": "ByteStreams" },
  "category": "Restaurant Technology"
}
</script>
```

STYLE GUIDE NOTES FOR THE BUILD

Typography:

- Headlines should be large and confident. Don't be afraid of 48-60px on desktop for section headlines.
- Body copy at 18-20px, generous line-height (1.5-1.6).
- Avoid all-caps except for the small section eyebrows. Eyebrows should be 11-12px, letter-spaced, in a muted color.

Spacing:

- Each major section should breathe — at least 96px of vertical padding top and bottom.
- Don't try to fit two sections in one viewport. Let the page scroll.

Color:

- The page should match dialtone.menu's existing palette. Don't introduce new colors for the features page.
- Allergen banners and "severe" indicators in the kitchen screenshot can use red — that's part of the product, not the marketing color palette.

Restraint:

- No animations beyond the voice sample player and maybe a subtle fade-in on scroll. No parallax. No carousels. No bouncing arrows.
- No emoji in the copy. The product is operational software, not a Slack message.
- No exclamation points except in the final CTA if it lands naturally.

Mobile:

- The page should read top-to-bottom on mobile as a coherent story.
 - Voice sample player must be prominent on mobile — many prospects will evaluate the product from their phone between dinner shifts.
 - Screenshots should be readable at mobile widths, not just shrunk.
-

SUGGESTED ORDER FOR BUILDING

1. Hero with voice sample (highest impact, prove the concept fast)
2. Final CTA section (close the loop, even if everything else is rough)
3. Section 2: Kitchen (the product's hero screenshot is real)
4. Section 1: Phone (sets up the problem)
5. Section 3: Payment (closes the customer-facing flow)
6. Section 4: Admin (closes the operator-facing flow)
7. Section 5: Configuration (the "fits your restaurant" reassurance)
8. Section 6: Roadmap (last because it's lowest priority)

If you only have an afternoon, ship Hero + Section 2 + Section 3 + Final CTA as a v0.1, then layer in the rest. A four-section page that loads the voice sample is better than a six-section page that's still in draft.
